**NAASCO Northeast receives FAA Approval  
For Hartman A-1077-Series Relays**

<http://www.naasco.com>

---

Shirley, NY, – NAASCO Northeast Corporation announced that it has received FAA-approval for the repair and overhaul of Hartman A-1077-Series relays. Until now, this series of relays, fitted to various fixed wing and rotary wing aircraft configurations, had been regarded as a non-repairable item. With the implementation of NAASCO’s “*Sil-Met*™” repair solutions for power relays, electrical contacts and terminal boards, these costly consumable components can be overhauled and returned to service with a fresh set of contacts and FAA 8130-3/JAA Form 1 tags.

John Leslie, President and CEO of NAASCO remarked, “Given the fact that most power relays found on today’s aircraft are indeed repairable, operators may not realize that there are affordable alternatives to purchasing NEW replacement parts from the OEM. Operators now have the option to renew there worn and burned relays by taking advantage of the cost-saving benefits of NAASCO’s exclusive *Sil-Met*™ technology”.

Since 1988, NAASCO has worked closely with major airlines, regional airlines and helicopter operators to provide cost effective repair solutions for power relay electrical contacts and terminal boards. NAASCO’s exclusive “*Sil-Met*™” technology allows previously consumable contacts and terminal boards to be repaired to “like new” condition.
